

Save Philly Festivals logo

DEMO GUIDE

Save Philly Festivals

Core Features Client Demo Guide

Purpose: step-by-step walkthrough script and dashboard demonstration guide

Scope: public discovery, schedule exports, and secure admin interfaces

Walkthrough Script

Platform Demo

Operations

This guide highlights the key functional areas of the modernized **Save Philly Festivals** application. It serves as a walkthrough script for demonstrating the system to clients, stakeholders, and operators.

☀️ Modernized Architecture & Design System

The application has been overhauled to follow a high-fidelity **glassmorphic design system** (inspired by Antigravity aesthetics). Key visual upgrades include:

- **Harmonious Color Palettes:** Sophisticated slate, amber, blue, and green HSL-based palettes replace raw defaults.
- **Accessible Visual Hierarchy:** Cards and layouts utilize smooth shadow systems, elevated borders, and clear semantic landmarks.
- **Next.js 13+ Compliance:** Eliminates all deprecated Next.js Link behaviors, resolving hydration warnings and guaranteeing optimal SEO routing.

Core Features Walkthrough

1. Public Festival Discovery & Interactive Calendar

Allows public visitors to search, filter, and explore all current and upcoming Philadelphia festivals.

- **Key Highlights:**
 - **Universal Search:** Real-time query submission reflecting URL query states for instant back/forward navigation.
 - **Accessible Calendar Grid:** Grid system exposing selected-day and month-control semantics for keyboard navigability.
 - **Intentional No-Results Fallbacks:** Clean empty states offering alternatives instead of dead ends.
- **Demo Scenario:**
 1. Navigate to the homepage `/`.
 2. Use the search input to filter for a keyword (e.g., "Beer").
 3. Toggle filters and navigate months on the `/calendar` tab. Note how the URL updates dynamically, preserving state.

2. Personalized Schedule Builder

Enables visitors to construct a custom itinerary of festivals and events without needing to register for an account.

- **Key Highlights:**
 - **Accountless Persistence:** Uses local storage to retain checked events across page refreshes.
 - **Schedule Export & Sharing:** Download selected itineraries as a clean `.txt` or `.ics` document, or email them directly.
 - **Granular Marketing Consent:** Separate, transparent checkmarks for organizer consent and general marketing emails.
- **Demo Scenario:**
 1. On the homepage, select **Add to Schedule** on multiple festival cards.
 2. Click the floating schedule summary to view the **Schedule Builder**.
 3. Enter an email address, configure marketing preferences, and trigger a test export.

3. Producer Submission Portal

A self-service workspace where festival coordinators submit their events for editorial review.

- **Key Highlights:**
 - **Save Draft Progression:** Save incomplete forms and resume editing later without risking data loss.
 - **Secure Private Asset Uploads:** Direct-to-storage upload of festival flyers, logos, and graphic assets.
 - **Live Status Badges:** Clearly labels state changes (e.g., `Draft`, `Pending review`, `Approved`, `Changes Requested`) on a timeline card.
- **Demo Scenario:**

1. Log in as a verified producer at `/login`.
2. Fill in the festival details (Name, Location, dates, and Description).
3. Upload an image file under **Promotional Asset**.
4. Click **Review submission** to see a read-only preview, then submit. The status transitions to **Pending review** and locks the input fields to prevent modification during review.

4. Admin Editorial Workflow

The command center for administrators to moderate submissions, enforce guidelines, and publish listings.

Queue State	Operator Action	System Consequence
Pending Review	Click <i>Approve</i> or <i>Publish</i>	Promotes to live calendar; sends email notice to Producer.
Pending Review	Click <i>Request Changes</i>	Sends draft back to Producer with feedback log; unlocks editing.
Approved	Click <i>Cancel Festival</i>	Generates a public Cancellation Tombstone on the discovery page.

- **Key Highlights:**
 - **Structured Feedback Loop:** Mandatory feedback messages when rejecting or requesting changes.
 - **Private Approvals:** Approve a festival to preview it securely before publishing it live.
- **Demo Scenario:**
 1. Navigate to `/admin/festivals`.
 2. Select the producer's submission from the **Pending review** tab.
 3. Reject the submission, prompting a modal. Enter a moderation reason and log it.
 4. Notice the state change timeline reflects the decision.

5. Moderated Social Feed Aggregator

Aggregates live social media posts (via hashtags) to display a community gallery on the festival details page.

- **Key Highlights:**
 - **Aggregation Providers:** Standard integrations for Flockler and Curator.io.
 - **Granular Post Moderation:** Review posts by marking them *Approved*, *Hidden*, or *Rejected*.
 - **Audit-Safe Moderation Reasons:** Enforces internal reason logs for hiding or rejecting social items to maintain operation logs.
- **Demo Scenario:**
 1. Go to the admin dashboard and select **Social Feed Manager**.
 2. Update the feed settings (e.g., Hashtag: `#PhillyBeerFest`).
 3. Click **Save social feed**. A confirmation toast will report the successful save.

4. Under the feed list, click **Hide** on a post. Type "Spam post containing off-topic advertisement" as the moderation reason to finalize the action.

[!NOTE] All core workflows described in this guide are backed by E2E verification tests to prevent regressions in production.
